* Physical Vapor Deposition (PVD)

Pvd is a field in the application of nanotechnology. The process consists of depositing layers of atoms, inside a vacuum chamber, to a solid surface. The layering is produced by the condensation of a vaporized metal (such as gold, titanium, platinum etc.) over the selected surface.

Advantages:

High resistance to abrasion and scratches; much higher than metals applied by firing. Excellent superficial strength. This process is applied in the manufacturing of tools destined to friction related applications. Resistant to chemical products, dissolvents and domestic cleaning products.

Corrosion resistant. ISO 9227
